The aim of the project is to create a optimized client for using on mobile J2ME devices capable of work with emails. Both POP3 and iMAP servers will be supported to retrieve mails. SMTP protocol will be used for sending emails. The client will also support MIME type attachments and display basic supported formats like: txt, jpg, png and other multimedia formats that are supported by user's mobile device. Standard mail boxes like Inbox, Outbox, Drafts, Trash... will be supported as well. Emails can be ordered by various user's criterias : by subjects, date, size and senders or recipients. The program will support

many email accounts. Automatic new emails checking. Operations that take longer time can be halted and whose progress will be displayed. Inteligent T9-like addressbook.
