

Many people invest their money in various assets in order to produce gain. Therefore, they need to monitor how their investments are doing. There are specialized applications for this purpose. However, most of the existing solutions contains only a limited amount of features, especially when it comes to displaying graphs. Users also usually can not decide where data is stored and retrieved from. In our work, we will therefore focus on creating a competitive application that will be expandable using plugins and at the same time simple to use with possibility of creating graphs and their user-defined layout within the dashboard. The simplicity of the application will also mean that, despite its extensibility, there will be no need to edit any configuration files. All settings will be configurable directly from the graphical user interface.
