

Bachelor document "Ethical tissue in the palliative care" has as a first objective to map the areas in which the categories as the death, dying, care about dying person, care about long-time ill are relevant and see them from the angle of the ethic and ethical approaches. Because of the fact of the reason to include also the view of the biomedicine results, I was using the name of tissue. My opinion is that this term the best reflex whole wideness of the problematic and maps all the areas, which are involved.
