

184 second grade girls from different primary schools were measured. Current body height, body weight, mid-arm circumference, body mass index and the skinfold thickness were established. All the body characteristics were statistically processed and they were analysed. The results are in a good agreement with current czech standards (V. and VI. Nation-wide Anthropological Survey of Children and Adolescents in the Czech Republic 1991, 2001), or in case of skinfold thickness (Bláha et al, 1999 a ). The results could be influenced by the optional permission of girls
