

The bachelor thesis deals with the issue of stuttering by adults. The first part summarises general informations about this communication disorder found in scientific literature. In the main centre of the thesis is the therapy. The second part of the bachelor thesis analyses the history of the respondents' disorder and description of markable signs of balbuties in the transcripts of video-recordings. The thesis is finished by presentation of data from questionnaire survey among speech therapists. The aim of this thesis is to provide a general overview of the most widely used therapeutics methods of stuttering by adults in our country.
