

The JAWS application (www.freedomscientific.com) is capable of allowing access of blind users to computer controls. Applications with graphical control elements that often substitute for standard controls of Microsoft Windows or applications that don't support full keyboard control have to be modified with JAWS scripting language to give out sounds and allow control of the sight impaired. This project describes creation of a script for specific application and analyzes what parts of the script can be automatically generated. At the same time we introduce JAWS Framework - application with included users manual, technical documentation and discussion of solutions according to the specification of our project.
