

Abstract (in English)

The subject of this thesis is the metamorphosis of intergenerational relationships within the family, which occur in the context of the social process of aging. The contemporary demographic trend has its deeper socio-economic context that currently the social policy of the state does not sufficiently reflect. It is necessary to perceive demographic aging as a metamorphosis of life cycle. The aim of this thesis is to present the proposition that the quality of intergenerational relationships is based on the entire life cycle of an individual, and therefore the reciprocity in the family can be influenced by appropriate measures of social policy. The aim of the thesis is (based on the available theoretical knowledge, using secondary data analysis and comparison of the data) to confirm the broader context of demographic aging and draw attention to the fact that in the preparation of social and political reform measures must deal with all relevant processes and not just the area of pension insurance.
