

Abstract (in English)

The aim of this bachelor thesis is a description of Musica Subject Gateway (MUS), which is provided by the National Library of the Czech Republic. The theoretical part defines the term *subject gateway*, described is the history of the subject gateways in the Czech Republic and their connection to the Uniform Information Gateway. Following is the formation of the gateway Musica. Mentioned are also the most important domestic and foreign information sources to which the gateway provides a unified access. The thesis describes services related to the portal – subject news and Czech office of the International Inventory of Musical Sources (RISM). Emphasis is also given on the used technology, which the MUS is based on. Those are the federated search MetaLib and SFX link server, which provides additional services. The practical part describes the search for information in the Musica Subject Gateway. In detail is described the accessibility of finding information, information sources and their classification into categories. Following is the case study in which are two respondents (graduate of conservatory, piano teacher) trying to find information in the gateway. Their efforts are described, analyzed and on its basis are drafted recommendations, that would make the search for information in the gate more user friendly for inexperienced users.
