

Bone pins of the Early Bronze Age are interesting, not too frequent, and still properly unprocessed kind of artifact. Probably based on an older tradition, but they were soon replaced by the metal pins. The main objective is to develop as most detailed catalog of findings as is possible, tracking the finding context and chronological position of bone pins in the Early Bronze Age in Bohemia. The subject of the work is also a question of technology used in the production bone and antler industry and its evidence from the Bronze Age, focusing on the technology and processes used in the production of bone pins. Another factor which is monitored is the social status of bearers of the bone pins in the Early Bronze Age.
