

Tumors of urogenital tract are a highly heterogenous group of lesions. In last 30 years, there were several classifications, which couldn't fully describe all neoplasias, especially those arising in kidneys, because many newly discovered tumorous entities still emerge. The most active institution concentrating on tumors of urogenital tract is International Society of Urological Pathology (ISUP).

As well as is diagnostics complicated, therapy of these tumors is also complicated in the same way. In some exchanging patterns main terapeutical procedures consist of surgical intervention, chemotherapy and radiotherapy. Biological targeted therapy is a treatment, that is very popular in these days.

There has been discovered only slice from the whole problematics of tumoral genetics, so that means lots of work to be done. This kind of resaech, as well as precise categorisation, is possible only at those places, that are capable of collecting realy large sum of tumors and pseudotumors, including leasions rare or new and yet not fully described.
